

Bonferroni Mean Pre-aggregation Operator Assisted Dynamic Fuzzy Histogram Equalization for Retinal Vascular Segmentation {Supplementary Material}

PURPOSE OF THE SURVEY

- Identification of retinal diseases through fundus image analysis.
- The featured image of the fundus images does assist in characterizing the disease identification more robustly.

THEORETICAL PROPOSITIONS AND PROOFS [1]

Proposition 1.1: For an eligible function C^* such that it is left conjunctive, and an eligible function M_2^* , the operator $B_{M_2^*}^{C^*}$ fulfills the boundary condition at the extreme point $\vec{0}$.

Proof 1.1: Since, C^* is left conjunctive, so we have $C^*(x, y) \leq x, \forall x, y \in [0, 1]$, which implies $C^*(0, y) = 0, \forall y \in [0, 1]$. Consider,

$$\begin{aligned} B_{M_2^*}^{C^*}(0, \dots, 0) &= \delta_{C^*}^{-1} \left[\frac{1}{n} \sum_{i=1}^n C^*(0, M_2^*(0 : j = 1 \text{ to } n, j \neq i)) \right] \\ &= \delta_{C^*}^{-1} \{0\} \end{aligned}$$

The injectivity of the function δ_{C^*} implies that $C^*(0, 0) = 0 = \delta_{C^*}(0)$, so we have

$$B_{M_2^*}^{C^*}(0, \dots, 0) = \delta_{C^*}^{-1} \{ \delta_{C^*}(0) \} = 0.$$

Hence, the boundary condition is satisfied at the extreme point $\vec{0}$.

Proposition 1.2: The sufficient condition for the operator $B_{M_2^*}^{C^*}$ to satisfy the boundary condition at the extreme point $\vec{1}$ is that the eligible function M_2^* is idempotent.

Proof 1.2: It is easy to verify that if the eligible function M_2^* is idempotent, then $B_{M_2^*}^{C^*}$ satisfies boundary condition at $\vec{1}$.

Proposition 1.3: For any eligible function $C^* : [0, 1]^2 \mapsto [0, 1]$ such that C^* is $(1, 1)$ -increasing, and for any eligible function M_2^* such that it is $\vec{1}$ -increasing, the operator $B_{M_2^*}^{C^*}$ is a $\vec{1}$ -increasing operator.

Proof 1.3: First, we prove that if C^* is $(1, 1)$ -increasing function, then δ_{C^*} is a non-decreasing function. For this, let $c > 0$, and consider,

$$\delta_{C^*}(x+c) = C^*(x+c, x+c) \geq C^*(x, x) = \delta_{C^*}(x) \quad \forall x \in [0, 1].$$

Hence, δ_{C^*} is a non-decreasing operator. Due to bijection of the operator δ_{C^*} , we have $\delta_{C^*}^{-1}$, and hence the function $\delta_{C^*}^{-1}$ as a strictly increasing function.

To show that $B_{M_2^*}^{C^*}$ is $\vec{1}$ -increasing operator, let $(x_1, \dots, x_n) \in [0, 1]^n$, and consider

$$B_{M_2^*}^{C^*}(x_1 + c, \dots, x_n + c) = \delta_{C^*}^{-1} \left[\frac{1}{n} \sum_{i=1}^n C^*(x_i + c, M_2^*(x_j + c : j = 1 \text{ to } n, j \neq i)) \right].$$

Since, M_2^* is $\vec{1}$ -increasing, so we have,

$$M_2^*(x_j + c : j = 1 \text{ to } n, j \neq i) \geq M_2^*(x_j : j = 1 \text{ to } n, j \neq i).$$

Also, C^* is an aggregation function, so we have,

$$C^*(x_i + c, M_2^*(x_j + c : j = 1 \text{ to } n, j \neq i)) \geq C^*(x_i, M_2^*(x_j : j = 1 \text{ to } n, j \neq i))$$

$$\begin{aligned} &\Rightarrow \sum_{i=1}^n \left\{ C^*(x_i + c, M_2^*(x_j + c : j = 1 \text{ to } n, j \neq i)) \right\} \\ &\geq \sum_{i=1}^n \left\{ C^*(x_i, M_2^*(x_j : j = 1 \text{ to } n, j \neq i)) \right\} \end{aligned}$$

Due to strictly increasingness of the function $\delta_{C^*}^{-1}$ over $[0, 1]$, the proof of the proposition follows.

Corollary 1.1: Let the eligible functions C^* and M_2^* satisfies the following properties:

- 1) C^* is left conjunctive and $(1, 1)$ -increasing function;
- 2) M_2^* is idempotent and $\vec{1}$ -increasing;

then the corresponding $B_{M_2^*}^{C^*}$ is a pre-aggregation function.

AGGREGATION OPERATOR FOR BENCHMARK

The proposed Bonferroni mean pre-aggregation operator is defined as:

$$B_{M_2^*}^{C^*}(\mathbf{x}) = \delta_{C^*}^{-1} \left[\frac{1}{n} \sum_{i=1}^n C^*(x_i, M_2^*(x_j : j = 1 \text{ to } n, j \neq i)) \right] \quad (1S)$$

where $\mathbf{x} = (x_1, \dots, x_n) \in [0, 1]^n$.

We have considered three different forms of C^* and M_2^* in Eq. 1S, and obtained the Bonferroni mean pre-aggregation operator as presented in Table 1S. The obtained form F_3 is a Bonferroni mean pre-aggregation operator since it is dependent on $h = \max(w_1, \dots, w_8)$, i.e., monotonicity increasing along a fixed ray direction. Additionally, we have considered the often-used classical aggregation operator Maximum and Averaging presented in Table 1S. The quantitative analysis is conducted

(a) Enlarged region of an image from STARE dataset, (b) green channel region, (c) vessel's feature extraction region, (d) prominent feature map region, (e) enhanced green channel region through fuzzy histogram equalization technique by using vessel's feature gray levels, (f) segmented vessels region of the enhanced green channel, (g) final segmented enhanced vessel region, and (h) ground truth enlarged region.

Table 1S
CONSIDERED BONFERRONI MEAN PRE-AGGREGATION OPERATOR AND AGGREGATION OPERATOR FOR BENCHMARKS IN BMPDFHESEG METHOD.

C^*	M_2^*	Notation
$C^*(w_{k_1}, w_{k_2}) = \min(w_{k_1}, w_{k_2})$	$M_2^*(w_{k_1}, \dots, w_{k_8}) = \frac{1}{7} \sum_{j=1}^8 w_{k_j}$	F_1
$C^*(w_{k_1}, w_{k_2}) = w_{k_1} w_{k_2}$	$M_2^*(w_{k_1}, \dots, w_{k_8}) = \frac{1}{7} \sum_{j=1}^8 w_{k_j}$	F_2
$C^*(w_{k_1}, w_{k_2}) = h\left(\frac{w_{k_1}^2 + w_{k_2}^2}{w_{k_1} + w_{k_2}}\right)$	$M_2^*(w_{k_1}, \dots, w_{k_8}) = \frac{1}{7} \sum_{j=1}^8 w_{k_j}$	F_3
Maximum	$\max(w_1, \dots, w_8)$	F_4
Averaging	$\sum_{i=1}^8 w_8 / 8$	F_5

using the presented operators in the BMPDFHESeg method over the DRIVE, STARE, and HRF datasets, as reported in Table 2S.

VISUAL COMPARISON BETWEEN THE L_1 , L_2 , AND L_∞ NORMS

We have extracted the feature maps by taking a sample image from the DRIVE dataset and employed L_1 , L_2 , and L_∞ norms during the feature extraction process, and the outcomes are shown in Fig. 1S. The inserts show a zoomed appearance of vasculature features as shown in Fig. 1S. The performance of L_∞ norm is more sensitive and not able to preserve the strong gradient information, as shown in Fig. 1S (c). Therefore, the performance of L_1 norm is more reliable compared to L_2 and L_∞ .

Fig. 4S. (a) Enlarged region of an image from STARE dataset, (b) green channel region, (c) vessel's feature extraction region, (d) prominent feature map region, (e) enhanced green channel region through fuzzy histogram equalization technique by using vessel's feature gray levels, (f) segmented vessels region of the enhanced green channel, (g) final segmented enhanced vessel region, and (h) ground truth enlarged region.
